

ABSTRACTPROTECTIVE PACKAGING SHEET

5 A protective packaging sheet which is particularly
suitable for packaging heavy loads such as coils of sheet
steel. The packaging sheet is formed from a plastics sheet
material having inherently relatively low compressions
10 strength and resistance to impact forces and bending. These
mechanical properties are vastly improved in the embossed
packaging sheet. At least one of the surfaces of the sheet
material is provided with shaped protuberances juxtaposed
with adjacent shaped protuberances to provide a gap around
15 each shaped protuberance. The shaped protuberances are
arranged in such a way that all straight lines projected
onto the surface cut through the shaped protuberances in
addition to the gaps.
